Literacy in the Sciences: Activity No. 2

Steps of the Scientific Process

One way parents can help children become interested in science is by explaining the scientific process. The scientific process is the way scientists go about asking and answering scientific questions by making observations and doing experiments.

Step 1: Ask a question

For the first step, help your child form a question, hopefully one that can be answered! Good questions start with question words: How, What, When, Who, Which, Why, or Where? For example, which cup holds the most water? Which of these four objects do you think will float in water?

Step 2: Do background research

For young kids, background research can include talking together about what they already know about the question they're asking. Maybe you have a book or have seen a show about the topic. The goal for this step is to engage your scientist in some thinking.

Step 3: Construct a hypothesis

A hypothesis is nothing more than a good guess at an answer to the question from Step 1. Ask your child, "Do you think the red cup or the blue cup will hold more water?" "Do you think the nail will sink or float? Do you think the aluminum foil boat will sink or float?"

Step 4: Test your hypothesis by doing an experiment

Here comes the part you and your child have been waiting for! Help your scientist carry out the experiment. Encourage your child to be a careful observer of everything that happens. Talk about the steps to the experiment. "First, let's fill up our pitcher with water. Then, slowly pour the water into the cup."

Step 5: Analyze the data and draw a conclusion

This step is all about results. What happened in the experiment? "Did the foil sink or float?" "Which cup held the most water?" At this stage, help your child answer the question developed in Step 1.

Step 6: Share your results

Encourage your child to talk with siblings and other caregivers about the experiment. Have him talk about the steps used to conduct the experiment and what he learned.

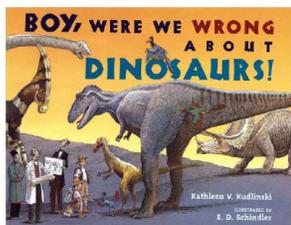

Science experiments can be quick and fun to do at home. Sharing the scientific process with your child will help him begin to think and plan as scientists do.

Reading Rockets, Colorín Colorado, and LD OnLine are services of public television station WETA, Washington, D.C. Reading Rockets is funded by the U.S. Department of Education, Office of Special Education Programs. Colorín Colorado, a web service to help English language learners become better readers, receives major funding from the American Federation of Teachers. Additional funding is provided by the U.S. Department of Education, Office of Special Education Programs. LD OnLine is the world's leading website on learning disabilities and ADHD, with major funding from Lindamood-Bell Learning Processes.

Literacy in the Sciences: Steps of the Scientific Process

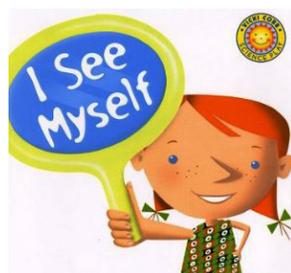

Recommended children's books

Boy, Were We Wrong About Dinosaurs

by Kathleen V. Kudlinski

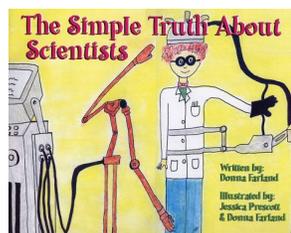

This is a very kid friendly introduction to how a scientific theory is formed through the careful collection and analysis of evidence – and how new evidence can turn a theory upside down. (Grades K–3)

I See Myself

by Vicki Cobb

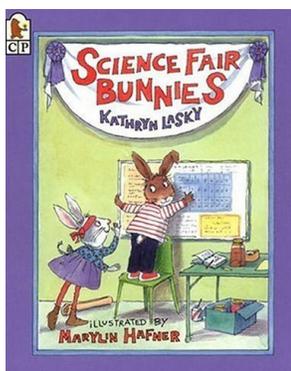

The child becomes the scientist in this picture book for preschoolers – a young girl finds out about vision, light, and reflection by playing with a mirror, a flashlight, and a bouncing ball. Part of the *Science Play* series, which encourages hands-on discovery about the world. (Grades PreK–K)

The Simple Truth About Scientists

by Donna Farland

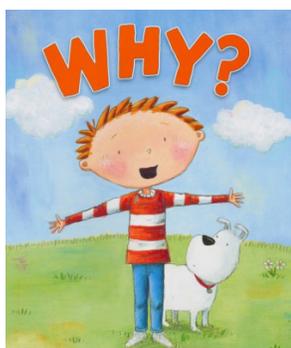

Bust all those myths and find out how real scientists use their sharp observation and predicting skills, test, collect data, and describe what they learn. (Grades K–1)

Science Fair Bunnies

by Kathryn Lasky

This entertaining story featuring the inquisitive Clyde and Rosemary introduces children to scientific reasoning, logic, predicting, experimenting, recording observations, charting data, and analyzing results. (Grades PreK–2)

Why?

by Richard Torrey

All scientific inquiry begins with a question, something at which Jack is quite adept. He wonders why crackers have holes, why feet stink, and why hair doesn't hurt when cut. This book is sure to generate even more inquisitiveness about children's everyday experiences. (Grades PreK–1)
